In a recommendation engine, Accuracy of the model is only calculated, when we see the output of the engine.

We have tested both the models and checked the accuracy of the model.

In case of book recommendation engine, we test the book title "The Queen of the Damned". In result we found, "Lives of the Mayfair Witches" more closest to the title and it is rightly guessed as far the storyline of the both.

In case of video Recommendation Engine, We matched the user profile with other users, those profiles have more cosine similarity that user likes will show to other users who has not seen the video.
