Capstone project 3
Recommendation System

I Decided to do two minor projects and club them to make a single project.

The core idea of both the projects is a recommendation System. The difference is only that one is based on user rating and the other is based on content.I will be using a total 5 dataset. Three for book recommendation and two for movie recommendation.

Aim: To get the best possible recommendation for Books and Movies.

In the book recommendation, We will use KNN model with the cosine similarity to get the similarity between users.Based on similarity of content or user rating our Recommendation System will work.
